

Marstons Technical Service Advice and Guidance

Dispense System Hibernation

MARSTON'S

1. Disconnect kegs and casks and connect to the line cleaning system.
2. Chase out beer with fresh water.
3. Clean beer lines as you would do each week following recommended process and wearing PPE.
4. Once your line clean is complete leave fresh water in the beer lines.
5. **Refresh the water every 7-10 days to ensure stagnant water does not contaminate the beer lines.**
6. Switch off remote cooler and turn off gas systems at the bottles.

In addition to the above – remove all spouts, creamer and sparklers from taps, wash them in hot water and leave to air dry in a safe place

Failure to follow the above process would result in irreversible contamination and unforeseen costs and damages
